

# inference for a small sample mean

# PLAYING A COMPUTER GAME DURING LUNCH AFFECTS FULLNESS, MEMORY FOR LUNCH, AND LATER SNACK INTAKE

distraction and recall of food consumed and snacking

**sample:** 44 patients: 22 men and 22 women

## **study design:**

- randomized into two groups:
  - (1) play solitaire while eating - “win as many games as possible”
  - (2) eat lunch without distractions
- both groups provided same amount of lunch
- offered biscuits to snack on after lunch

| <i>biscuit intake</i> | $\bar{x}$ | <i>s</i> | <i>n</i> |
|-----------------------|-----------|----------|----------|
| <b>solitaire</b>      | 52.1 g    | 45.1 g   | 22       |
| <b>no distraction</b> | 27.1 g    | 26.4 g   | 22       |

# estimating the mean (based on a small sample)

point estimate  $\pm$  margin of error

$$\bar{x} \pm t_{df}^* SE_{\bar{x}}$$

$$\bar{x} \pm t_{df}^* \frac{s}{\sqrt{n_s}}$$

$$\bar{x} \pm t_{n-1}^* \frac{s}{\sqrt{n}}$$

**Degrees of freedom for t statistic  
for inference on one sample mean**

$$df = n - 1$$

# finding the critical t score using the table

1. determine df

$df = 22 - 1 = 21$

2. find corresponding  
tail area for desired  
confidence level

| one tail  |    | 0.100 | 0.050 | 0.025 | 0.010 | 0.005 |
|-----------|----|-------|-------|-------|-------|-------|
| two tails |    | 0.200 | 0.100 | 0.050 | 0.020 | 0.010 |
| df        | 1  | 3.08  | 6.31  | 12.71 | 31.82 | 63.66 |
|           | 2  | 1.89  | 2.92  | 4.30  | 6.96  | 9.92  |
|           | 3  | 1.64  | 2.35  | 3.18  | 4.54  | 5.84  |
|           | 4  | 1.53  | 2.13  | 2.78  | 3.75  | 4.60  |

|           | 27 | 1.31  | 1.70  | 2.05  | 2.47  | 2.77  |

# finding the critical t score

using R

R

```
> qt(0.025, df = 21)
```

```
[1] -2.079614
```

Estimate the average after-lunch snack consumption (in grams) of people who eat lunch **distracted** using a 95% confidence interval.

$$\bar{x} = 52.1 \text{ g} \quad \bar{x} \pm t^* SE = 52.1 \pm 2.08 \times \frac{45.1}{\sqrt{22}}$$

$$s = 45.1 \text{ g}$$

$$n = 22$$

$$t_{21}^* = 2.08$$

$$= 52.1 \pm 2.08 \times 9.62$$

$$= 52.1 \pm 20 = (32.1, 72.1)$$

*We are 95% confident that distracted eaters consume between 32.1 to 72.1 grams of snacks post-meal.*

Suppose the suggested serving size of these biscuits is 30 g. Do these data provide convincing evidence that the amount of snacks consumed by distracted eaters post-lunch is different than the suggested serving size?

$$\bar{x} = 52.1 \text{ g}$$

$$s = 45.1 \text{ g}$$

$$n = 22$$

$$SE = 9.62$$

$$H_0: \mu = 30$$

$$H_A: \mu \neq 30$$

$$T = \frac{52.1 - 30}{9.62} = 2.30$$

$$df = 22 - 1 = 21$$

# finding the p-value using the table

1. determine df

$$df = 21$$

2. locate the calculated T score in the df row

3. grab the one or two tail p-value from the top row

$$0.02 < p\text{-value} < 0.05$$

| one tail  | 0.100 | 0.050 | 0.025 | 0.010 | 0.005 |       |
|-----------|-------|-------|-------|-------|-------|-------|
| two tails | 0.200 | 0.100 | 0.050 | 0.020 | 0.010 |       |
| df        | 1     | 2     | 3     | 4     | 5     |       |
|           | 1     | 3.08  | 6.31  | 12.71 | 31.82 | 63.66 |
|           | 2     | 1.89  | 2.92  | 4.30  | 6.96  | 9.92  |
|           | 3     | 1.64  | 2.35  | 3.18  | 4.54  | 5.84  |
|           | 4     | 1.53  | 2.13  | 2.78  | 3.75  | 4.60  |
|           | 5     | 1.48  | 2.02  | 2.57  | 3.36  | 4.03  |
